PRESIDENT UNIVERSITY
2025

PT. KORINA ABADI TEHNIK

Kawasan Segitiga Emas Jababeka (Pintu 6)

Jl. Samsung Raya Blok B No.9E-9F

Desa Mekarmukti, Kec. Cikarang Utara, Bekasi-Jawa Barat

Telp : 0817-7522-1010/ email : korinaabadi20@gmail.com

SURAT KETERANGAN MAGANG

Nomor : 2210/KAT/SKAB/2026

Yang bertanda tangan di bawah ini :

Nama : Yopi Sohibul Sapal
Jabatan : Manager HRD
Perusahaan : PT KORINA ABADI TEHNIK

Dengan ini menyatakan bahwa :

Nama : Eka Ade Putra Kurniawan
NIM : 012202305036
Program Studi : Information System
Universitas : President University

Telah Selesai untuk melaksanakan kegiatan magang di PT KORINA ABADI TEHNIK pada Divisi/Departemen Quality Control, terhitung mulai tanggal 22 September 2025 sampai dengan 9 Januari 2026.

Selama bekerja di perusahaan kami yang bersangkutan telah menunjukkan pengertian atas pekerjaan dan tanggung jawab dan pelaksanaan tugas dengan baik.

Demikian surat ini dibuat untuk digunakan sebagaimana mestinya.

Bekasi, 9 Januari 2026
Hormat kami,

PT. KORINA ABADI TEHNIK

Yopi Sohibul Sapal
Manager HRD

PREFACE

This internship final report was prepared as a requirement for completing the internship program in the Information Systems Study Program at President University.

First, I would like to thank God Almighty for the opportunity, strength, and guidance that allowed me to complete my internship and finish this report. During the internship period, I faced various challenges, both technical and non-technical, which helped me learn and grow personally and professionally.

I would like to express my sincere gratitude to Sir Yopi Sohibul Sabal, as the Manager HRD and supervisor at PT Korina Abadi Teknik , for giving me the opportunity to conduct my internship at the company. His guidance, feedback, and practical insights into accounting and taxation processes were very valuable throughout the internship.

I also would like to thank all staff and operator QC members at PT Korina Abadi Teknik for their assistance, cooperation, and support during my daily work activities.

My appreciation also goes to Sir Ronny Juwono as my academic advisor from President University for his guidance and suggestions during the internship program and the preparation of this report.

Finally, I would like to thank my family and friends for their continuous support and encouragement. I hope this report can provide a clear overview of my internship experience and be useful for readers.

CHAPTER I: INTRODUCTION

1.1 Background of the Internship

This semester, President University offers several streaming programs, including mobility programs, scholarship programs, and internship programs. The internship program is the option most students choose because of the many benefits it offers. For night students or students who already work, this program is very helpful because the internship can be applied directly to their current job. Therefore, I chose the internship program as my streaming track this semester.

An internship is a platform for students to practice their skills in the real business world. Many studies state that business internships are beneficial experiences that help students transition into the professional working environment (Knouse & Fontenot, 2008). In addition, internships are also useful for employers because they help companies evaluate and recruit potential future employees (Gabris & Mitchell, 1989; Gault, Redington, & Schlager, 2000; Hurst, 2008).

In this internship, I worked at an Electronics Manufacturing Company in the Quality Control (QC) Department. My primary responsibilities included conducting product inspections, recording and analyzing defect data, and generating quality reports for vendor evaluations. Although this operational role was not directly aligned with my major, Information Systems, I proactively sought to bridge this gap. Throughout my internship, I aimed to design and implement a digital system that could streamline the manual data collection and reporting processes, thereby enhancing overall efficiency and data-driven decision-making, all while diligently fulfilling my daily QC duties.

1.2 Objectives of the Internship

My objective is to improve the business processes in my office. I intend to analyze the current business workflow to identify problems or inefficient processes that can be improved. In addition, I aim to help the company find and solve problems while also completing my daily tasks. To perform my daily tasks properly, I also need to learn more about the company's work processes and job responsibilities.

1.3 Scope of Work

- QC Operations : Conduct physical and functional inspections of products from vendors based on checklists, and report non-conformities.
- Data Management : Building a digital database of inspection results, analyzing defect trends, and creating visual reports on vendor performance.

- System Development: Designing and implementing digital tools (databases and dashboards) to improve the efficiency of QC reporting processes.
- Coordination : Communicate with the Procurement team and vendor representatives regarding quality findings.

1.4 Benefits of the Internship

- Industry Insight : Gain deep insight into the challenges and best practices in quality management and vendor relationships in the manufacturing industry.
- Networking : Building professional connections.
- Management Skills : Learning to manage time, data, and resources.
- Skill Acquisition : Gaining more experience and developing new skills.

CHAPTER II: COMPANY PROFILE

2.1 History of Organization

PT. Korina Abadi Teknik is a manufacturing company specializing in the production of precision plastic components, particularly housings or covers for remote controls for various electronic devices. The company provides a range of services, from mold design, injection molding, assembly, to final quality control. PT. Korina Abadi Teknik is led by a professional with certifications in quality management and manufacturing engineering, as well as over 10 years of experience in plastic injection molding. With this experience, the company has supported many clients from the consumer electronics, household, and automotive industries in providing precision, durable components that comply with applicable regulations and quality standards.

2.2 Vision, Mission and Objective

- Vision : To be a trusted leader in providing high-quality electronic solutions by integrating precision engineering with innovative quality assurance systems.
- Mission : To deliver superior electronic components that consistently meet and exceed customer specifications through rigorous quality control processes and continuous improvement.
- Objective : The objective of PT. Korina Abadi Teknik is to ensure the highest level of product quality and reliability for our clients by efficiently managing our supply chain, optimizing vendor performance, and maintaining strict compliance with industry standards and regulations.

2.3 Organizational Structure

2.4 Business Activities Core

The core activities of PT Korina Abadi Teknik focus on the precision molding and assembly of plastic components, specifically remote control covers and electronic casings for consumer electronics manufacturers. The company's operations integrate injection molding, quality control, assembly, and logistics to deliver high-volume, high-precision components to its clients in the electronics industry.

2.5 Products and Services

1. Manufacturing Services

PT Korina Abadi Teknik specializes in plastic injection molding services with a focus on electronic enclosures. Our services include:

- Precision Plastic Injection Molding
- Value-Added Assembly Services
- Quality Assurance & Control

2. Technical & Support Services

The company also provides comprehensive technical support throughout the product lifecycle:

- Product Development Support
- Prototyping and rapid tooling services
- Material selection consultation
- Supply Chain Management
- Vendor-managed inventory (VMI) programs
- Logistics and customs clearance support
- Quality System Implementation
- ISO 9001:2015 quality system maintenance support
- Process validation and capability studies

2.6 Review on Organization Growth and Trend

Over the years, PT Korina Abadi Teknik has demonstrated consistent growth by maintaining strong, long-term partnerships with major consumer electronics brands and adapting to evolving market demands for remote control components. The company has steadily expanded its production capacity and technical capabilities, allowing it to serve a wider range of clients in the home appliance and entertainment industries.

CHAPTER III: INTERNSHIP ACTIVITIES

3.1 Description of Assigned Tasks and Responsibilities

During this internship, During this internship at PT. Korina Abadi Teknik, my responsibilities were divided into two main areas: the academic project required by the university and daily operational tasks within the Quality Control (QC) department. For the academic project, the goal was to design and implement an Information Systems-based solution to improve the QC workflow, enhance data management efficiency, and streamline the reporting process. This project specifically focused on digitizing the manual inspection recording system and developing a data dashboard for vendor performance monitoring. addition to the project, I was entrusted with the following daily operational responsibilities:

Tasks	Description
Quality Inspection	- Conducting visual and functional inspections of plastic covers and remote components from multiple vendors. - Verifying dimensional accuracy, surface finish, and assembly integrity based on engineering specifications.
Data Recording & Reporting	- Manually logging inspection results (passed/rejected quantities, defect types) into paper-based checklists
Vendor Coordination Support	- Assisting in communicating quality issues to vendor representatives. - Supporting the tracking and verification of corrective actions submitted by vendors.

3.2 Timeline of Activities

Project application Timeline

Timeline	Activities
----------	------------

22 September – 30 Oktober	- Conducted in-depth observation and analysis of the existing QC workflow, focusing on manual data recording from inspection sheets and inefficient vendor communication reports.
1 November – 30 November	- Created the first version of the Looker Studio (Google Data Studio) dashboard, connecting it to the live database to visualize key metrics like Daily Reject Rate and defect summaries.

	- Built the foundational Google Sheets database with standardized forms for inspection data entry
1 December – 30 December	- System Testing & Refinement: Conducted User Acceptance Testing (UAT) with the QC team. Gathered feedback on the dashboard's usability and data input forms.
1 January – 9 January	- Deployment & Training: Officially launched the digital system for daily use. Conducted a training session for the QC team on how to input data and interpret the dashboard. The system began replacing the manual reporting method..

3.3 Tools, Technologies, or Methods Used

To complete my tasks and the development project, I utilized the following tools and technologies:

- Data Management & Analysis : Google Sheets, Microsoft Excel.
- Data Visualization & Reporting : Google Data Studio.
- Quality Control Tools : Sample Jigs, Cutter.
- Programming : Google Apps Script.
- Statistical Process Control : Basic SPC concepts
- Documentation & Planning : Google Docs, Google Drive.
- Defect Analysis Methods : Check Sheets

3.4 Challenges Encountered and How They Were Solved

During the internship, I faced several challenges related to operational workflow, data management, and stakeholder communication.

One challenge was the inefficient and error-prone manual data recording system for QC inspections. Initially, all inspection results (pass/reject quantities, defect types) were recorded on paper checklists, which were prone to being lost, illegible, and difficult to consolidate for analysis. This made tracking vendor performance over time a slow and inaccurate process. To solve this, I designed and implemented a centralized digital database using Google Sheets. I created a structured form with dropdown menus for standardized data entry (vendor name, defect type, part number). This solution transformed disorganized paper records into an accessible, searchable digital log, enabling real-time data tracking and eliminating physical storage issues.

Another significant challenge was translating raw inspection data into actionable insights for management and vendors. A simple list of defects was not compelling enough to drive change or justify requests for process improvement to vendors. To overcome this, I taught myself data visualization techniques using Google Data Studio (Looker Studio). I built an interactive dashboard that automatically converted the database entries into clear visualizations: trend lines for reject rates, Pareto charts for the most frequent defects, and comparative bar charts for vendor performance. This allowed me to present data-backed evidence during review meetings, making the case for quality improvements much more persuasive and objective.

I also encountered resistance to change from the established manual workflow. Some team members and vendor representatives were initially skeptical of the new digital system, preferring the familiar paper-based method. To address this, I adopted a collaborative approach. I demonstrated the tangible benefits of the digital system by quickly generating reports that previously took hours. I also provided one-on-one guidance to team members, showing them how easy it was to use the new sheets. For vendors, I shared summarized, visual reports from the dashboard, framing it as a tool for mutual improvement rather than just criticism, which helped gain their buy-in.

A another challenge was dealing with incomplete or inconsistent data from vendors, such as missing batch numbers or unclear defect descriptions in their delivery notes,

which hampered accurate tracking. To minimize this, I proactively designed a standardized communication template and shared it with key vendor contacts. This template outlined the precise information our QC process required. By standardizing the input, I significantly reduced data entry errors and streamlined the reconciliation process between their records and our inspections.

3.5 Achievements and Results

First, the digital system I developed significantly improves operational efficiency. The integrated dashboard and database automatically process inspection data from manual Excel spreadsheets into visual reports that are ready for analysis. Tasks that previously took up to 4 hours to collect and summarize weekly inspection data can now be completed in 30 minutes, allowing the QC team to focus more on in-depth analysis and corrective actions in the field.

Second, this system helps reduce human error in recording and reporting. By replacing manual data input, which is prone to typos or miscalculations, the system ensures consistency and accuracy of defect data. Defect categories that were previously written with different variations are now standardized through a dropdown list, facilitating pattern analysis and root cause analysis.

Third, the system improves data tracking and quality storage capabilities. All inspection histories, reject rates per vendor, and defect trends are stored centrally and structured in a cloud database. This allows teams to easily review vendor performance over time, track the effectiveness of corrective actions, and reduce the risk of losing important data that was previously only stored in physical files.

Finally, this system is designed for ease of use by the entire QC team. The intuitive dashboard interface and interactive data visualization allow supervisors and managers, even those with non-technical backgrounds, to monitor quality performance in real time, filter data by vendor or specific period, and make data-driven decisions more quickly and confidently.

CHAPTER IV: PERSONAL RESULT

4.1 Technical Skills

During this internship, I gained valuable technical skills that supported my professional development. I learned how to design and implement a centralized quality control database using Google Sheets with advanced functions like data validation and query formulas. I also developed expertise in creating interactive data dashboards using Google Data Studio (Looker Studio) to visualize key quality metrics. Furthermore, I gained practical knowledge of quality inspection techniques specific to plastic injection molding, including dimensional measurement, visual defect identification, and functional testing for remote cover components. This hands-on experience helped me understand how quality management systems operate in a manufacturing environment.

4.2 Soft Skills

Beyond technical abilities, I cultivated essential soft skills throughout the internship. I improved my time management significantly while balancing daily inspection duties with data analysis tasks. My data organization capabilities were enhanced as I systematically structured quality records for easy retrieval and analysis. I also refined my communication skills, particularly when discussing defect findings with vendor representatives and presenting data-driven insights to the procurement team. Learning to ask precise questions when encountering unfamiliar quality issues proved invaluable for my professional growth.

4.3 Professional Attitude Development

This internship helped me develop a more professional attitude toward work. I learned to maintain discipline in following inspection schedules and meeting reporting deadlines consistently. I trained myself to remain focused during detailed visual inspections, where minor defects in remote covers could impact final product quality. The experience also taught me the importance of maintaining professional relationships, communicating respectfully with both internal teams and external vendors, and collaborating effectively in a production-focused environment where quality and delivery schedules are equally critical.

4.4 Comparison Between Theory and Practice

During my academic studies, I learned theoretical concepts about database management, data visualization, and quality management systems. However, working in an actual manufacturing setting revealed that practical application is far more

nuanced. For instance, while database theory emphasizes normalization and relationships, the practical challenge involved designing a system that shop floor inspectors could use easily with minimal training. Similarly, quality concepts studied in class focused on statistical process control, but real-world implementation required understanding material properties of ABS/PP plastics, molding process parameters, and how they influence defect formation in remote covers. Developing data solutions for actual users differed from academic projects because it required considering workflow constraints, varying technical literacy among users, and the fast-paced production environment where data entry needed to be both accurate and efficient.

4.5 Self-Evaluation

From this internship experience, I recognized that I need to further develop my skills in statistical analysis to perform more sophisticated quality trend analysis. I also identified opportunities to improve my assertiveness when following up with vendors regarding corrective actions. While I managed multiple responsibilities effectively, I could enhance my prioritization techniques when facing urgent quality issues alongside routine reporting tasks. Despite these areas for improvement, I demonstrated strong initiative in digitalizing manual processes and believe I made substantial progress in both technical implementation and cross-functional collaboration.

4.6 Feedback from Supervisor or Colleagues

My supervisor provided positive feedback regarding my proactive approach to improving the quality documentation system. They appreciated my initiative in creating the digital dashboard, which allowed real-time monitoring of vendor quality performance. The procurement team mentioned that the data visualization I developed helped them negotiate more effectively with vendors based on objective quality metrics. Colleagues in the QC department valued the simplified data entry system I implemented, noting it reduced administrative time and minimized recording errors. My supervisor encouraged me to continue developing my analytical skills and consider how similar digital solutions could be applied to other manufacturing processes.

4.7 Overall Performance Assessment

Overall, I believe my performance during this internship was strong and impactful. I successfully fulfilled my daily quality inspection responsibilities while simultaneously designing and implementing a digital quality management system that brought measurable efficiency improvements. The database and dashboard I created have

become integral tools for the quality department. I gained practical technical skills in data management and visualization, developed essential soft skills for professional communication, and acquired valuable insight into manufacturing quality systems. Although I have identified areas for further growth, this internship has effectively prepared me for future roles in industrial information systems, business analytics, or quality management, particularly in manufacturing environments.

CHAPTER V: RECOMMENDATION

5.1 Conclusion

Throughout this internship at PT. Korina Abadi Tektik, I gained invaluable experience that bridged my academic knowledge in Information Systems with real-world industrial applications. Working as a Quality Control (Stand by Vendor) intern provided me with a deep understanding of how quality management principles are practically implemented in a molding and electronics manufacturing environment. I learned not only the technical aspects of product inspection but also the critical importance of vendor relationship management in maintaining supply chain integrity.

My main project, the development of a digital QC database and visualization dashboard, demonstrated how information systems can transform operational efficiency. By replacing manual, paper-based recording systems with a structured digital solution, I was able to contribute to tangible improvements in data accessibility, reporting speed, and analytical capabilities. This experience taught me that technology serves as a powerful enabler when thoughtfully aligned with business processes.

This internship vividly illustrated the distinction between classroom theory and workplace practice. Concepts like database management, data analysis, and process optimization became much more meaningful when applied to solve actual business challenges, such as reducing defect rates and improving vendor performance monitoring. Moreover, I developed essential professional competencies including cross-functional communication, problem-solving with data-driven approaches, and the discipline required in a quality-focused manufacturing environment. Overall, this internship has been instrumental in preparing me for a career at the intersection of information technology and operations management.

5.2 Recommendations

Recommendations for the Company

Based on my internship experience, Expand the digital QC system I developed to cover all inspection points across production lines, not just incoming materials from vendors. Formalize a vendor scorecard system based on the dashboard metrics, with regular performance reviews and joint improvement initiatives.

Recommendations for the Internship Program

The internship program already provides clear and well-structured guidance for

students. It is recommended that this standard be maintained to support students in completing the internship effectively.

Recommendations for Myself

For my personal development, I need to continue improving my project management capabilities, particularly in implementing digital solutions in traditional manufacturing environments with varying levels of technological readiness.. I also need to improve my focus and stress management when handling multiple tasks. By developing these skills, I believe I will be better prepared for future projects and professional work.

Figure 5 Sample of Spreadsheet From Excel Data

Monthly Report

22 September 2025 - 30 October 2025

1. Principal Assignments and Responsibilities

- Conducting incoming quality inspections on raw plastic materials (ABS, PC) from vendors
- Performing dimensional and visual checks on molded remote cover samples using calipers and visual inspection guidelines
- Documenting inspection results (pass/fail) and defect details in the daily QC log
- Creating and updating the digital QC database in Google Sheets for all inspection records
- Analyzing weekly defect trends to identify recurring quality issues in the molding process
- Participating in quality meetings with the Production and Procurement teams
- Reporting non-conformances to vendor representatives and tracking corrective actions
- Assisting in the preparation of First Article Inspection (FAI) reports for new mold trials

2. Important Aspects Learned

During September, significant learning occurred in plastic injection molding quality parameters, especially understanding critical-to-quality (CTQ) characteristics such as sink marks, flash, and dimensional stability. Knowledge of statistical process control (SPC) concepts improved through practical application in monitoring process variations. This month also contributed to better analytical skills through systematic review of defect data, helping identify that 65% of rejections were related to gate vestige issues on specific cavity numbers. Additionally, I gained practical understanding of how quality data flows from production floor to vendor management decisions.

3. Problems or Challenges and How They Were Resolved

The main challenge in October was inconsistent defect classification among QC inspectors, leading to unreliable trend analysis. Another difficulty was the manual data entry process which was time-consuming and prone to transcription errors. These challenges were minimized by:

Acknowledged by,

PT. KORINA ABADI TEKNIK

Signature and Name Supervisor Stamped

Date: 09 January 2026

Monthly Report

01 November 2025 - 30 November 2025

1. Principal Assignments and Responsibilities

- Conducting comprehensive quality audits on finished remote cover batches using sampling standards
- Developing and implementing a digital dashboard prototype in Google Data Studio to visualize QC performance metrics
- Coordinating with the Production Department to conduct trial runs with adjusted molding parameters (temperature, pressure, cooling time)
- Validating corrective actions implemented by vendors based on previous month's quality findings
- Training two QC team members on the new digital recording system and defect classification standards
- Preparing a monthly vendor performance report with rejection rates, defect breakdowns, and improvement recommendations
- Assisting in the calibration of measurement equipment (calipers, vision measurement system)

2. Important Aspects Learned

In November, significant progress was made in data-driven quality management. I gained practical experience in developing a QC performance dashboard that automated the aggregation of inspection data into key metrics like Overall Equipment Effectiveness for molding machines and First Pass Yield. This process deepened my understanding of manufacturing analytics and how visualization tools can transform raw inspection data into actionable insights. Additionally, I learned about process capability analysis by studying dimensional data from critical remote cover features, and how these statistical measures inform decisions about mold maintenance and process adjustments.

3. Problems or Challenges and How They Were Resolved

The main challenge in November was integrating data from multiple disconnected sources (paper checklists, Excel files, machine logs) into a unified dashboard. Another difficulty was resistance to data transparency from some production operators who were concerned about performance monitoring.

Acknowledged by,

PT. KORINA ABADI TEKNIK

Signature and Name Supervisor Stamped

Date: 09 January 2026

Monthly Report

01 December 2025 - 9 January 2026

1. Principal Assignments and Responsibilities

- Leading the finalization and deployment of the QC Digital Dashboard to the production management team
- Conducting capability studies on critical-to-quality dimensions
- Developing standardized work instructions for new QC inspectors based on data from recurring defect patterns
- Coordinating cross-functional quality improvement projects between Production, Engineering, and Procurement departments
- Analyzing cost of poor quality data to quantify financial impact of defects and justify improvement investments
- Preparing a comprehensive handover documentation including dashboard user manual, data collection procedures, and troubleshooting guide
- Validating the effectiveness of implemented corrective actions by tracking defect rates before and after process changes
- Participating in supplier quality audits for two key raw material vendors

2. Important Aspects Learned

In December, I gained a strategic perspective on quality management by learning how quality metrics directly impact business outcomes like customer satisfaction, production costs, and supplier relationships. Through the analysis, I understood how seemingly small defect percentages translate to significant financial losses. I also developed project management skills by leading the dashboard implementation from pilot phase to full deployment, including change management aspects. The capability studies provided practical experience with statistical analysis tools and how they inform decisions about process control limits and equipment maintenance schedules.

3. Problems or Challenges and How They Were Resolved

The primary challenge in December was ensuring sustainability of the digital systems I implemented beyond my internship period. There were concerns about maintaining the dashboard and data collection procedures. Additionally, integrating legacy manual records with the new digital system created data consistency issues.
